

Q: Repo and branching

A: https://github.com/cshukei/todo_app

master → requirements as per stated in the assessment.

dev → extra feature: tick the todo to mark as done. There is a new page to show the todo that have been done.

Q: What kind of storage has been chosen? Why?

A: Database. Although the question/requirements stated that the data of the session will be reset for every session, but didn't state to remove the data. In professional way, we should not remove any data to prevent any data loss. There are a lot websites stores user data in order to provide customize services.

Q: How the data reset and not display in the web?

A: There is a column "active" with bool data dict. By default, it will be set as True when a todo is created. It will be updated to False, when the session end. The todo list table will only display the todo with active=True.

Q: Understanding on Version Control System (VCS)

A: Git, I have used Sourcetree as a software tool to view the repo status.
